Saccharomyces cerevisiae
Eukaryota: Fungi: Ascomycota; Saccharomycetales;
Bucharomycetaces: Saccharomyces.

(bases 1 to 5056)
MORTISON_A. Christensen, R.B., Alley, J., Beck, A.K., Bernstine, E.G., Lemontt, J.F. and Lawrence, C.W.
REV3, a Saccharomyces cerevisiae gene whose function is required for induced mutagenesis, is predicted to encode a nonessential DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /translation="mSRESNDTIQSDTVRSSSKSDYFRIQLNNQDYYMSKPTFLDPSH

Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones.

Exceptions are indicated by an explicit note.

Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

IMPORTANT: This sequence is not the entire insert of clone E02AlO. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone C14ClO is at 23796 in this sequence. The true right end of clone F45D3 is at 107 in this sequence. The start of this sequence (1. 108) overlaps with the end of sequence (23793. 23889) overlaps with the start of sequence 27402B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Caenorizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizaburizabur

Exceptions are indicated by an explicit note. IMPORTANT: This sequence is NoT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small coverlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The end of this sequence (36252. .36355) overlaps with the start of sequence 277131.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 jes@sanger.ac.uk or rw@nematode.wustl.edu

Current sequence finishing criteria for the C. elegans genome sequence finishing criteria for the C. elegans genome sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NoT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlapping sections once, or longer because we arrange for a small file sequence is the entire insert of clone T2IC9. The true right end of clone F32C8 is at 17256 in this sequence. The start of this sequence (1. 105) overlaps with the end of sequence 272509.

The end of this sequence (37442. 37545) overlaps with the start of sequence 295392.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2.2 Mb of contiguous nucleotide sequence from chromosome III of C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Submitted (10-MAY-1996) Louis, MO 63110, USA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene.chcbnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (sea Eddy, http://genome.wustl.edu/eddy/RRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit. http://ftp.genome.washington.edu/RW/RepeatMasker.html). Regions of genomic sequence that are not annotated as genes but have predicted exons by GRAIL are anotated as misc features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /protein_id="AAD23652.1"

BAC clone T22F11 is from Arabidopsis chromosome II and is near the
molecular marker GPA1.

Direct Submission

NL Submitted (27-Aug-1999) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA on Sep 3, 1999 this sequence version replaced gi:5788096.

All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997)

http://ftp.genome.washington.edu/RM/RepeatMasker: html.

* Nord: This record contains 113 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* vorellap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will

* horselved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          contig of 802 bp in length gap of unknown length; contig of 822 bp in length gap of unknown length contig of 801 bp in length gap of unknown length

The present sequence was obtained from a library of clones of S. aureus WCHH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of requiatory elements for the control of bacterial gene expression. The encoded protein may be used control of bacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                         DNA encoding an autolysin and 3 unknown proteins. PT PERSON WITTL, WITTL.

New nucleic acid sequences from Staphylococcus aureus WCHU29 -

New nucleic acid sequences from Staphylococcus aureus WCHU29 -

PT useful in vaccines and for treatment of bacterial infections of e.g.

Tespiratory tract and central nervous system

Claim 1: Page 214-216; 390pp; English.

Claim 2: Page 214-216; 390pp; English.

Claim 3: Page 214-216; 390pp; English.

Claim 3: Page 214-216; 390pp; English.

Claim 4: Page 214-216; 390pp; English.

Conditions which may be treated include bacterial infections, especially artimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. Pylori infection.

C sequence 3110 BP; 1111 A; 48B C; 676 G; 676 G;
                                                                              DNA encoding 2 Staphylococcus aureus proteins of unknown function. Staphylococcus aureus protein; immune response induction; eye infection; antibody production; T-cell immune response; gastrointestinal infection; respiratory infection; inhibitor; bacterial infection; cardiac infection; central nervous system; kidney infection; urinary tract infection; antimicrobial compound identification; broad spectrum antibiotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Staphylococcus aureus contig SEQ ID #20.

Polynucleotide(s) and proteins derived from Staphylococcus aureus - Polynucleotide(s) and proteins derived from Staphylococcus aureus - Polynucleotide(s) and proteins derived from staphylococcus aureus Protein or computer readable medium and used in the production of anti-S. aureus vaccines

This sequence represents one of 5191 Staphylococcus aureus DNA sequences

Cof the invention. The DNA sequences are conductor a computer readable computed from a floppy or hard disk, random access of the invention. The DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can also be used in a vaccine composition adainst S. aureus infection of S. aureus in a sample. S. aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences of for recombinant production of the polypeptides. The new DNA sequences contained on the computer readable medium.

This nucleotide sequence comprises novel human tumour rejection
antigen precursor (TRAP) MAGE-C1 cDNA (see also V69720). MAGE-C1
is a novel member of the MAGE family that may be recognised by
cytotoxic T cells, leading to lysis of the tumour cells which
express it. MACE-C1 and MACE-C2 (see W81546-47) are expressed in a
cytotoxic T cells. The MAGE-C2 (see W81546-47) are expressed in a
normal cells. The MAGE-C1 cDNA was isolated from a melanoma
colls. The MAGE-C1 cDNA was isolated from a melanoma
commal cells. The MAGE-C1 cDNA was isolated from a melanoma
commal cells. The MAGE-C1 cDNA was isolated from a melanoma
commal cells. The MAGE-C1 cDNA was isolated from a melanoma
commal cells. The MAGE-C1 cDNA was isolated from a melanoma
composition of the MAGE-C2 cDNA (see V69728) are claimed, as are: expression
vectors; transformed or transfected cell lines (e.g. COS and CHO);
an isolated TRAP encoded by the cDNAs; a kit useful in a PCR based
assay comprising an oligonucleotide having a sequence of
nucleotides as equence which is complementary to nucleotides 200-217 of
the 4031 bp cDNA sequence; a method for determining expression of
a MACE-C1 gene using the kit; a polytope comprising a number of
tumour rejection antigens derived from MAGE-C1 or MAGE-C2 and a
collytope comprising at least one tumour rejection
antigen. MACE-C1 and MACE-C2 can be used in a method for determining
the presence of cytolytic T cells specific for complexes of a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour rejection antigen precursors - used for determining presence of cytolytic T cells specific for complexes of a human leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1167 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumour rejection antigen precursor MAGE-C1 cDNA.

This nucleotide sequence encodes novel human tumour rejection
This nucleotide sequence encodes novel human tumour rejection
This nucleotide sequence encodes novel human tumour rejection
antigen precursor (TRAP) MAGE-C1 (see W81546). MAGE-C1 is a novel
Cells, leading to 1951s of the tumour cells which express it.
Cells, leading to 1951s of the tumour cells which express it.
CMACE-C1 and MAGE-C2 (see W81547) are expressed in a variety of
tumours and in normal testis cells, but not by other normal cells.
The MAGE-C1 cDNA was isolated from melanoma L8373-MEL CDNA by
CPCR amplification (see V69732-33). It shows homology to MAGE-A1
CDNA (see V69719). The MACE-C1 gene was localised to Xq26-q27.
CMACE-C1 and MAGE-C2 CDNAS (see V69726) are claimed, as are:
captression vectors; transformed or transfected cell lines (e.g. COS
and CHO); an isolated TRAP encoded by the CDNAS; a kit useful in a
CPCR based assay; a method for determining expression of a MAGE-C1
cgene using the Kit; a polytope comprising a number of tumour
rejection antigens derived from MAGE-C1 or MAGE-C2; and a polytope
                                                                                                                                                                                                                                                                                                                                                                                mour rejection antigen precursors - used for determining presence cytolytic T cells specific for complexes of a human leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 comprising at least one tumour rejection antigen derived from "AGE"-C1 mAGE-C2 and at least one other tumour rejection antigen. MAGE-C1 and MAGE-C2 and be used in a method for determining the presence of cytolytic I cells specific for complexes of a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                           This sequence from the R26 library which may be used in the conjugate of the sequence from the R26 library which may be used in the conjugate of the sequence from the R26 library which may be used in the conjugate of the sequence of an analyte of interest. The attached to a functional surrogate of an analyte of interest. The conjugate of an analyte of interest. The surrogate is capable of competing effectively with the analyte for a limiting amount of an affinity receptor for the analyte. The conjugate exhibits an activity that is altered upon interaction with the affinity can be measured and related to the amount of the analyte present in a sample. Functional surrogates such as this have an immunoreactive group that allows the surrogate to compete effectively and with the analyte for a limiting amount of its affinity receptor.

Competined surrogates are able to minic naturally occurring analytes.

They can be labelled for use in standard competitive affinity assays (esp. homogenous immunoassays) for detecting large macromolecules such as polypeptides, polyperides, polymocleciales, polycoproteins and allergens, hormones related to fertility-pregnancy or analytes associated allergens, hormones related to fertility-pregnancy or analytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, follicle stimulating hormone, human glacental contionic gonadotropin, human luteninising hormone, whuman placental contionic gonadotropin, human luteninising hormone, cytomegalovirus, contampled or analytes associated contamposity in a protection and incomplemental contamplemental conformation conformation conformation conformation conformation conformation contamplemental conformation conformation conf
                                   O'NOV-1997 (first entry)

DNA encoding MAb anti-HBSAg binder sequence, B13, from R26 library.

Functional surrogate: analyte; affinity receptor; immunoreactive group;

minic; homogenous immunoassay; detection; diagnostic analyte; Chlamydia.

This invention describes a novel method for identifying a nucleic acid
that encodes a polypeptide which affects covalent coupling of
polypeptides to the surface of Gram-positive bacteria. The method
identifies mutations in bacterial factors that (in)directly interact
with the LeXTG-motif dependent C-terminal anchorage of polypeptides,
particularly pathogenicity factors, to the cell surface. The products
of the invention have antibacterial activity and are potentially
useful as therapeutic agents, inhibiting binding of bacteria to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 W0916894 Seq ID 7.
Active agent; covaling; Gram-positive bacteria; inhibitor; adhesion; extracellular matrix; LPXTG motif-dependent anchorage; pathogenicity factor; bacterial cell wall; therapeutic agent; ss. Unidentified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                08-APR-1999.

This invention describe a novel method for identifying an active agent that affects covalent coupling of polypeptides to the surface of Gram-positive bacteria. The agents identified inhibit matrix in the polypeptide-induced adhesion of bacteria to extracellular matrix in the host. The active agent effects the LPXIG motif-dependent anchorage of pathogenicity factors to the bacterial cell wall and are potentially useful as therapeutic agents, inhibiting binding of bacteria to extracellular matrix in the host.

This sequence is not described in the specification but is represented
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 8: Page 48: 105pp; English.

The promoter (T3364) of the arabinofuranosidase gene of Aspergillus niger 3M43 was identified in a full-langth gene (T33645) Isolated from a genomic DNA library. The promoter is strongly repressed by glucose and induced by intermediates of xylose metabolism. It can be used to control the expression of a gene of interest, e.g. A. niger arabinofuranosidase or a heterologous gene, in a host cell, pref. Aspergillus or a transgenic plant.

Protein: and related plasmids, transformed E.coli and recombinant protein: and related plasmids, transformed E.coli and recombinant protein: and related plasmids, transformed E.coli and recombinant proteins, useful in enanticoselective prodn of L-carnitine

T proteins, useful in enanticoselective prodn of L-carnitine

E. Claim 1; Page 17-18; 32pp; French.

The nucleotide sequence of the E.coli L-carnatine dehydratase (CDH) gene designated calB. The sequence forms part of the carnatine operon which cashing the accessory protein CaiE encoded by the calE gene (O98554).

The sequences were obtained from E.coli strain 04474 which was isolated from rat intestine. The calB gene was obtained by screening an E.coli chromosomal DNA ilbrary with the probes O98555-7, based on the N-terminal sequence derived from the purified enzyme. The 1.3 kb Mul-MulI caiB sequence derived from the purified enzyme. The 1.3 kb Mul-MulI caiB sequence derived from the microbiological prodn. of L-carnatine from cortonobetaine. L-carnatine is an essential factor in long chain fatty acid transport across internal mitochondrial membranes. It can be used to treat L-carnatine sequence had to stimulate prodn. 313 A; 330 C; 311 G; 261 T;

                                                                                                                                                             ONA encoding alkaline liquefying alpha-amylase - useful in dish-washing and laundry detergents for removal of starch dirts claim 8. Page 23-26. 40pp. English.

This sequence represents the coding sequence for an alkaline liquefying alpha-amylase. Alpha-amylase is an enzyme that acts on starch-related polysaccharides. Nadrolysing the alpha-14-qlucoside bond of the polysaccharide molecule. Alkaline liquefying alpha-amylases exhibit resistance to surfactants used in detergents, and decompose starch or starch-related polysaccharides in a highly random manner. The Bacillus species KSM-AP1378, from which this sequence was isolated, is an alkalophilic Bacillus strain. It was isolated from soil in the vicinity of the city of Tochigi. The enzyme is useful in improving the efficiency of dish-washing and laundry detergents, particularly on starch dirts. Sequence 1776 BP: 575 M. 305 C; 417 G; 479 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New equine and canine interferon - and recombinant DNA molecules coding for them, and transformed cells. Disclosure: Fig 12: 149pp; German. Miscrosganisms transformed with the recombinant sequence produce IFN which is useful therapeutically in veterinary medicine. Aspergillus arabinofuranosidase - useful for degradation of arabinoxylan
Tarabinoxylan
Example: Page 52-55; 105pp; English.

The Aspergillus niger 3M43 arabinofuranosidase gene (T33646)
The Aspergillus niger 3M40 arabinofuranosidase gene (T33646)
C codes for the precursor form (W00810) of the arabinofuranosidase enzyme. It was isolated from a genomic DNA library by screening with a PCR clone obtd. by amplification of A. niger DNA using primers (see also T33644-45) based on an isolated peptide (W00806)
C the enzyme. The mature enzyme coding sequence (see also T33640)
C an be used for prodn. of arabinofuranosidase (W04167) in transformed hosts, pref. Aspergillus or a transgenic plant. The promoter (see also T33641), terminator (T33643) and signal sequence (T33643) may also be used to control expression of the arabinofuranosidase gene, or other gene of interest, in a host
                                                                                                                                                                                                                                                    Aspergillus arabinofuranosidase gene.
Arabinofuranosidase; AbfC; arabinoxylan; viscosity modifier; food; feedstuff; ds.

The proton gradient is used to drive ATP synthesis from ADP and Pi. The method can be used for optimising the formation of blomass or a desired product, e.g. the product may be lactic acid which results in the acidification of dairy products. The method is more efficient than currently used methods of blomass production.

The present invention describes a computer readable medium which has the present invention describes a computer readable medium which has the present invention describes a computer readable medium which has the nucleotide sequence at least 95% identical to SEQ ID No: 1 to 391. The nucleotide sequence at least 95% identical to SEQ ID No: 1 to 391. The nucleotide sequences depicted in SEQ ID No: 1 to 391. The present invention also describes an isolated nucleic acid molecute encoding a homologue of any of the fragments of the S. pneumoniae genome (SEQ ID No: 1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a process comprising: (a) screening a genomic DNA library using as a process comprising: (a) screening a genomic DNA library using as a process comprising members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mana, DNA or cDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologues to amplification primers derived from the sequence is homologues to amplification primers derived from the isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical compositions and vaccines for S. pneumoniae. 1415 G; 2057 T; sequence 6735 BP; 2122 A; 1141 C; 1415 G; 2057 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              membrane trafficking
Claim 25; Page 32; 59pp; English.
W04180-83 are novel human cellubrevins (CB-1, -2, -3 and -4). CBs
can be used for the study and regulation of vesicle trafficking in
normal, and in acute and chronic disease situations, and for the
diagnosis and treatment of conditions caused by infection, traumatic
tissue damage, hereditary disease, e.g. asthma or arthritis, invasive
cancer, leukaemia and lymphoma or other physiologic/pathologic problems
associated with induced, and otherwise abnormal, membrane trafficking.
In particular, the CB-4 polynucleotide (isolated from a cerebellum
library (CRBLNOT01) can be used in a diagnostic test for conditions or
diseases in which its expression is induced, e.g. cerebellar degenerative
diseases or brain tumours, while CB-4 inhibitors can be used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    N-PSDB; TS9908.
Purified RNA polymerase II holo:enzyme - comprises RNA polymerase II and one or more regulatory proteins, pref. suppressor of RNA polymerase B proteins or SNI/SNF proteins Claim 11; Fig 10a-b; 154pp; English.

Production of the proteins for use as vaccines and recombinant production of the proteins for use as vaccines and recombinant production of the proteins for use as vaccines and recombinant production of the proteins isolated from the helminth of laim 137-140; 84pp; English.

W76769-W76777 represent ankyrin proteins isolated from the helminth parasites Directions is many an useful for the recombinant production of the ankyrin polypeptides. These proteins can then be used as vaccines against parasitic helminth, e.g. D. immitis or B. malayi. They can also be used any after infection, and to raise antibodies, also for use in the repeptides, as passive immunogens, or as therapeutics against helminths on conjugation to cytotoxic agents. The nucleic acids contained in themselves or in vectors may be used as genetic vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
Novel yeast SRB (suppressor of RNA polymerase B) proteins SRB4, SRB5, SRB6, SRB7, SRB8, SRB9, SRB10 and SRB11 (W13821-28) are transcription regulatory factors that act as positive and negative regulators of RNA polymerase II activity, and are components of the RNA polymerase II octivity, and are components of the RNA polymerase II holoenzyme. They were identified using methods designed to identify transcription factors involved in RNA polymerase II c-terminal domain (CTD) function. SRBs and SRB9 appear to repress CTD activity. Genomic clones (T5994-II) for the SRBs have been obtd. SRBs can be used to treat diseases resulting from alteration or deletion of the SRB gene, pref. by gene transfer technology. They can also be used in in vitro transcription of DNA and to identify cpds. that modify gene transcription.

Dirofilaria and Brugia ankyrin proteins and antibodies - useful for protection of animals from disease cused by parasitic helminth claim 5; Columns 137-140; 84pp; English.
The present sequence represents a Brugia malayi ankyrin protein. The ankyrin protein, or anti-ankyrin antibodies, may be used to protect an animal from disease caused by a parasitic helminth, especially where the disease is heartworm disease, elephantiasis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tabel- Phosphorylation

KW Ankyrin; helminth; parasite; vaccine; therapy; infection; KW passive immunogen; cytotoxic agent.	OS Dirofilaria immitis. PN US5827692-A. PD 27-0CT-1998. PF 24-APR-1997; 847429. PR 24-APR-1997; US-847429. PA (HESK-) HESKA CORP. PI Blehm ES, Tang L; DR WPI; 98-593992/50.	PT Nucleic acids encoding ankyrins from helminth parasites - useful for recombinant production of the proteins for use as vaccines and PT recombinant production of the proteins for use as vaccines and PT recombinant helminth infection. PS Example 2, Column 35-36, 84pp, English. CC W76778-W76802 are ankyrin-like repeat peptide fragments isolated from CC helminth parasite. Dirofilaria immitis pulahaki075 protein. Such ankyrin-CC nucleic acids and recombinant products are useful for the recombinant CC production of the ankyrin polypeptides. These proteins can then be used as vaccines against parasitic helminth, e.g. D. immitis or B. malayi.	They can also be used for therapp after intection, and to faise a can the faise of antibodies, also for use in therapeutics, as passive immunogens, cc therapeutics against helminths on conjugation to cytotoxic agent cc and the nucleic acids contained in viruses, may also be used as viral vacc and the nucleic acids themselves or in vectors may be used as get convacines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note of a cids encoding ankyrins from helminth parasites - useful for recombinant production of the proteins for use as vaccines and recombinant production of the proteins for use as vaccines and recombinant production of the proteins.

Treatments against helminth infection are useful for the recombinant products are useful for the recombinant products are useful for the recombinant production of the ankyrin polypeptides. These proteins can hen be used as vaccines against can parasitic helminth, e.g. D. immitis or B. malayi. They can also be used for therapy after infection, and to raise antibodies, also for use in the rapeutics, as passive immunogens, or as therapeutics against helminths or cytotoxic agents. The nucleic acids contained in viruses, may also be used as viral vaccines, and the nucleic acids themselves or in vectors may be used as genetic vaccines.
                                                                                                                                                                                                                                                                    New modified peptide(s) - obtained by substitution with an amino acid which is modifiable by a reaction and replacing other amino acid which is modifiable by a reaction and replacing other amino acids which are not to be modified.

Claim 7; Page 22; 33pp; English.

The peptides w77376-W77390 can be modified by the method of the cinvention by substituting at least one amino acid of the peptide to provide a peptide having at least one amino acid which is modifiable by a reaction and replacing other amino acids in the peptide with amino acids which are not modifiable by the reaction. The methods can be used for the modification of biologically active peptides such as hormones, drugs, toxins and peptides which act on lipid bilayer membranes. The modified peptides can be used e.g. in the body of an animal or plant or parts in corder to affect the structure or integrity or permeability of a foreign body such as a microorganism, parasite or virus present in the body of the animal or plant or within the cells of the body of the animal or

protection of animals from disease caused by parasitic helminth claim 5: Columns 79-82: 84pp; English.

The present sequence represents part of a Dirofilaria immitis ankyrin protein. The ankyrin protein, or anti-ankyrin antibodies, may be used to protect an animal from disease caused by a parasitic helminth, especially where the disease is heartworm disease, elephantiasis or

Para-hydroxybenzoate hydroxylase; para-hydroxybenzoic acid; PHBA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 4; Page 39-41; 60pp; English.

This is the amino acid sequence of a Pseudomonas mendocina para-hydroxypenzoate hydroxylase (PHBH). P. mendocina possesses two highly homologous pobA genes (see V84270-71), both of which encode PHBH enzymes (see W88281-82) able to convert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Nocleic acids encoding ankyrins from helminth parasites - useful for recombinant production of the proteins for use as vaccines and recombinant products are useful for the recombinant production of the parasitic helminth, e.g. D. immitis or B. malayi. They can also be used as vaccines against parasitic helminth, e.g. D. immitis or B. malayi. They can also be used for therapy after infection, and to raise antibodies, also for use in therapeutics, as passive immunogens, or as therapeutics against helminths or conjugation to cytotoxic agents. The nucleic acids contained in viruses, may also be used as viral vaccines, and the nucleic acids contained in themselves or in vectors may be used as genetic vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  useful as antigenic protein for vaccine

Spisclosure: Fig 1: 13pp: English.

CDNA was prepd. from FIPV straim 79-116. N81533 gives the sequence

of the peplomeric gene in three reading frames. The top reading

frame is an open reading frame of 4356 nucleotides and has a coding

capacity for a precursor polypeptide having a mol. Wt. of 160.470

(1452 AAs). The beginning and the end of the E2 gene are indicated

in the FT of N81533. The first 18 N-terminal AAs have a strong

hydrophobic character and presumably comprise a cleavable signal

ceptide. The extreme carboxy-terminal part comprises a region of 20

hydrophobic AAs, which presumably serves as a transmembrane anchor.

The FIPV peplomeric protein has 35 potential glycosylation sites,

of which 22 are in the N-terminal part (post) which corresponds

to the S-part of the IBV E2 (see P81183). N.B. IBV = infectious

bronchitis virus. "X" in the AA sequence denotes the translation
para-hydroxybenzoic acid (PHBA) to protocatechuate. A claimed method for the production of PHBA comprises: (a) culturing a pobA(-) Pseudomonas strain in a medium containing an aromatic organic substrate (e.g. toluene or p.cresol), at least one C.source (e.g. qlucose or succinate) and an N-source, where the pobA(-) Pseudomonas strain comprises pobA genes encoding the toluene monoxygenase toluene degradation pathway and where the pobA(-) Pseudomonas strain does not produce any detectable PHBH activity config to pobA gene distruption, so that PHBA accounlates at a rate of about 0.01-1 g PHBA/G.cell.hr; and (b) recovering the PHBA. The PHBA is used as a monomer for liquid crystal polymers. Esters of PHBA an also be used as backbone modifiers in condensation polymers, e.g. polyesters, and are also used to make paraben
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       29-OCT-1992 (first entry)
Sequence encoded by the 2nd reading frame of the peplomeric gene
of FIVP strain 79-1146.
                                                                                                                                                                                                                                                                                                                                                  ö

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of ER3061-R83085, R83090-R83096 and R92907-R92914 represent fragments of is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                         HLA-B2702 CTL modulating peptide (B2702.84-75/75-84). 
Yototoxic rilymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 38, Application US/09031485
Patent No. 5824306
GENERAL INFORMATION:
GENERAL INFORMATION:
TAPLICANT: Blehn, E. Scot
TITLE OF INVENTION:
TITLE OF INVENTION: DIROFILARIA AND BRUGIA ANKYRIN
TITLE OF INVENTION: DROFILARIA NUCLEIC ACID MOLECULES, AND
TITLE OF INVENTION: USES THEREOF
CORRESPONDENCES: 85
CORRESPONDENCE ADDRESS:
ADDRESSEE: Garol Talkington Verser, Ph.D.
STREET: 1825 Sharp Point Drive
CITY: Fort Collins
STATE: Colorado
CONNTRY: USA
                                                                                                                                                                                                                                                                                                                                                            Length 1226;
                                                                                                                                                                                                                                                                                                                                                                                                 1; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     COMPUTER READABLE FORM:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                               probable finger protein YKL222c - yeast (Saccharomyces cerevisiae)
N;Alternate names: hypothetical protein F705
C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Date: 03.May.1994 #sequence_revision
C;Accession: S38066; S44510; S43548
R;Alterandrath, D; Horatitis, O; Tzermia, M.
Submitted to the Protein Sequence Database, March 1994
A;Reference number: S38065
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A;Status: translation not shown
